## 1. INTRODUCTION

Buru Energy (Company) has developed the *Well Drilling and Workover Environment Plan* (HSE-PLN-048) (Environment Plan) for the management of environmental aspects associated with the following proposed well operations (the Activity):

- drilling and testing of the Kurrajong 1, Rafael 1, Ungani 4 side-track, Ungani West 1, Ungani East A, Ungani South A and Yakka Munga 1 wells; and
- workover of the Ungani 4(ST1) and Ungani 5 wells to install downhole pumps.

Note that the naming of the 'Ungani East A' and 'Ungani South A' wells is not final.

This Summary Document summarises the operations and mitigation measures in the Environment Plan.

### 2.1. Timing

Operations are expected to commence in Q3 2018; however, timing is dependent on numerous factors including rig availability and funding.

### 2.2. Civil Construction

The new well sites and access tracks will be constructed as part of the Activity. Within the well sites, the following infrastructure will be established:

- water storage facilities (turkeys nest and/or tanks);
- rig hardstand area;
- cuttings sump; and
- well cellar and conductor.

Subsoil removed from the cuttings sumps and turkeys nest (if present) will be utilised for levelling and gently sloping the well site away from well centre to provide drainage during rainfall events. The well sites and access tracks will be stabilised as required (e.g. using gravel, cement blend).

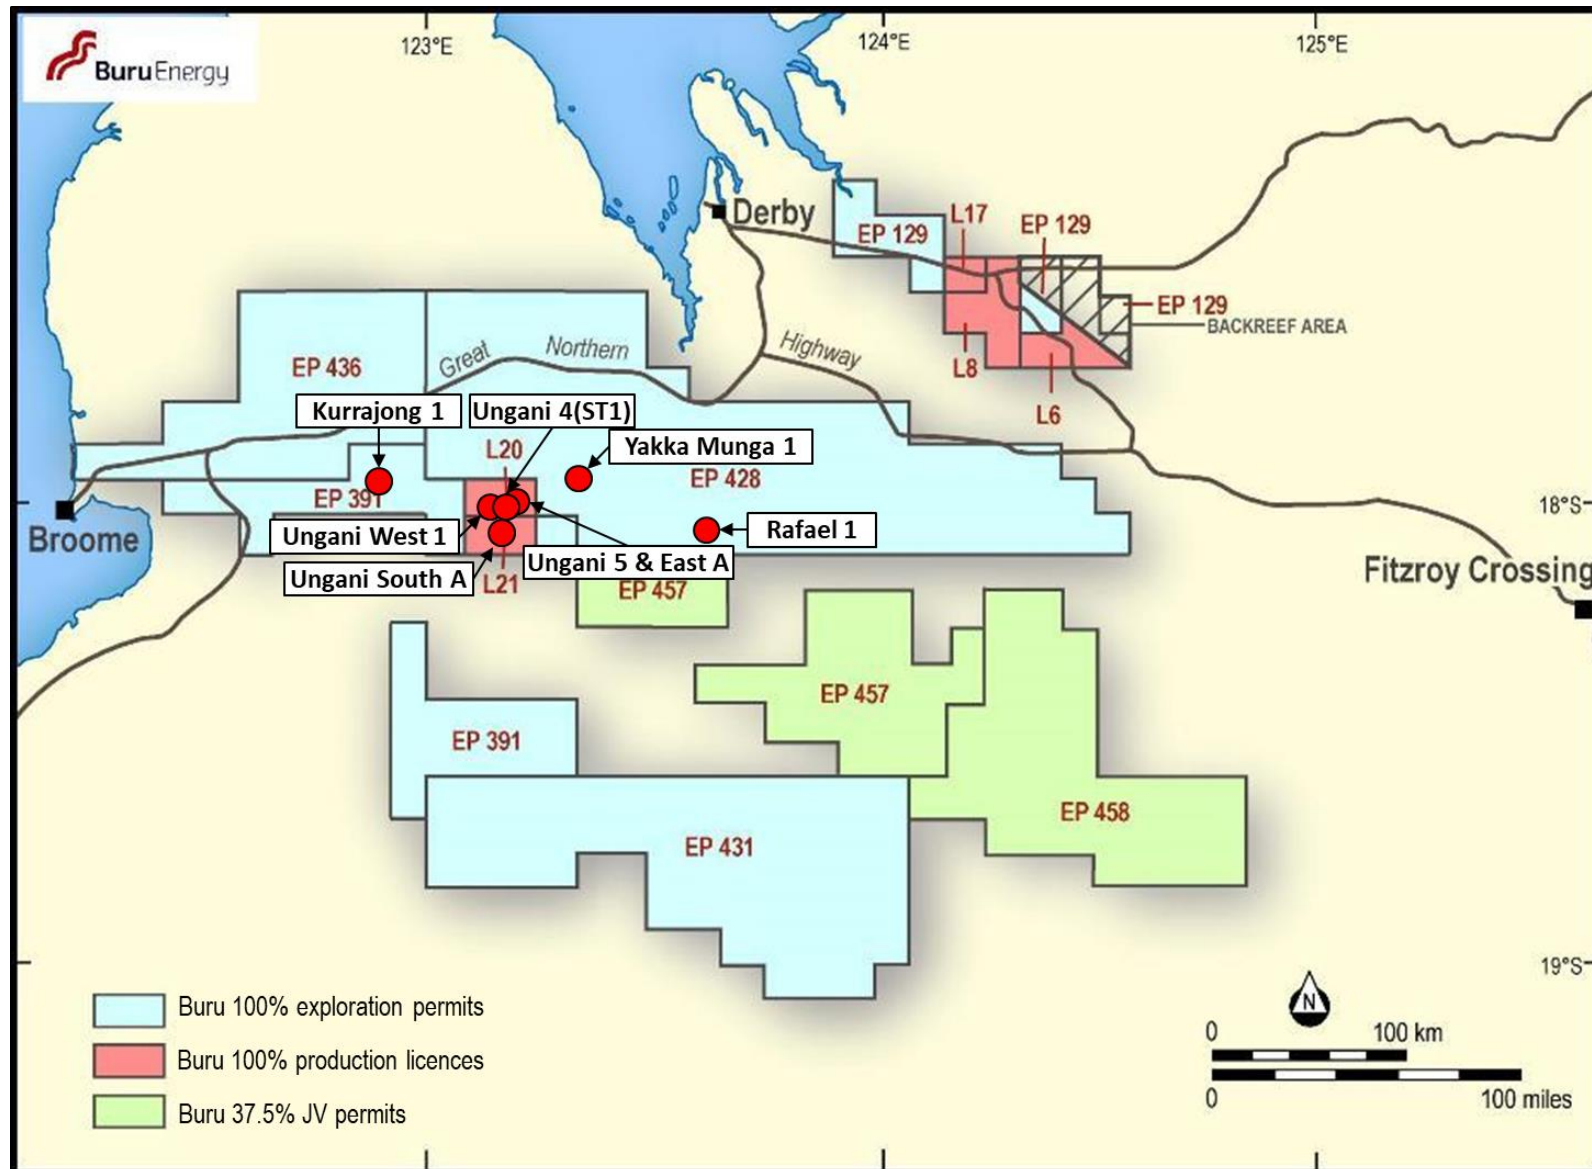

Figure 1: Location of the Activity areas.

## **2.3. Well Drilling and Testing**

The drilling rig will operate 24 hours a day, seven days a week with two crew shifts totalling approximately 30 personnel for the drilling operations. A Company Representative will supervise the Activity.

Drilling a well generally involves the following key stages:

- drilling the well as a number of hole sections/intervals with decreasing diameter;
- installing steel well casings in drilled hole sections;
- filling the annulus outside the well casings with cement as required for well integrity; and
- conducting wireline logging of hole sections.

Further testing may be conducted to evaluate prospective zones if positive results of hydrocarbons are determined during initial testing, or to test injectivity of the well. This will be undertaken following completion of drilling operations and demobilisation of the drilling rig.

### **2.3.1. Mud and Cuttings**

All chemicals and other substances to be used down hole during the Activity have been fully disclosed in accordance with Regulation 15(9) of the *Petroleum and Geothermal Energy Resources (Environment) Regulations 2012* and *Chemical Disclosure Guideline* (DMP 2013). Full chemical disclosure is provided in Appendix A, with all Material Safety Data Sheets (MSDSs) provided in Appendix B.

During drilling, returned drilling mud and cuttings will be treated to separate solids and liquids. A lined cuttings sump will be constructed within the well site for storage and settling of drilling mud and cuttings.

## **2.4. Pump Installation**

It is expected that artificial lift will be required to be installed to ensure production rates from the Ungani 4(ST1) and Ungani 5 wells can be sustained. Installation of downhole pumps will require workovers of the production wells. Workover of the Ungani 4 well will be done in two stages, prior to and after the side-track drilling.

### **2.4.1. Downhole Fluids**

During well workovers for pump installation, suspension fluid will be used downhole. All chemicals and other substances that would be used downhole during workovers have been fully disclosed in Appendix A, with all MSDSs provided in Appendix B.

## **2.5. Water Source**

Water for the Activities will be sourced from existing water bore/s or new water bore/s. Construction of each bore and taking of water will be licensed in accordance with the *Rights in Water and Irrigation Act 1914* administered by the Department of Water and Environmental Regulation.

## **2.6. Waste Management**

Waste likely to be generated during the Activity can be classified as putrescible waste, general waste, industrial waste and septic waste. Waste will be managed and monitored in accordance with the Company *Waste Management Procedure* (HSE-PRO-005). Sewage will be treated through an Aerated Wastewater Treatment System on site.

## **2.7. Demobilisation and Rehabilitation**

Depending on the results of the testing, at completion of drilling each well, the well will either be suspended or plugged and abandoned. In either case the well site will be demobilised in accordance with the Environment Plan.

Following removal of all infrastructure, including the disposal of waste to a licensed waste disposal facility, the Activity area will be rehabilitated in accordance with the Company *Rehabilitation Operations Procedure* (HSE-PRO-025).

### **3. ENVIRONMENTAL IMPACTS AND MANAGEMENT MEASURES**

The Activity will be confined to the Activity area. A summary of the existing environmental characteristics of the Activity area, potential impacts that could result from the Activity and the risk of these potential impacts occurring is provided in Table 2. Included in this table are also the management and mitigation measures that form part of the implementation strategy to minimise environmental risk.

Table 2: Summary of the existing environment, potential impacts and management approach associated with the Activity.

Environmental Characteristic	Description	Potential Impact	Key Management Measures	Risk	Implementation Strategy
Surface and ground water	<p>The Fitzroy River itself is located over 20 km from the nearest wellsite. There are some areas subject to inundation during the wet season from around 500 m away from the Activity areas.</p> <p>Depth to groundwater in the Activity area is around 30-45 m.</p>	Contamination of surface and/or ground water.	<ul style="list-style-type: none"> <li>Well Control with blowout preventer (BOP).</li> <li>Proactive management of operations in regards to extreme weather events including consideration of long term weather forecasts.</li> <li>If operations are undertaken during the wet season, chemical storage areas will be covered.</li> <li>Cuttings and drilling fluid stored and handled in accordance with the <i>Cuttings, Soil and Fluid Management Procedure</i> (HSE-PRO-007) including containment within tanks or lined areas.</li> <li>The bore water use will be as low as operationally practicable and in accordance with licence.</li> <li>Sewage and grey water will be treated through Aerated Wastewater Treatment System.</li> <li>Rain water in bunds following rainfall events will be managed by assessing the water within the bund for contamination. Only non-contaminated water will then be pumped onto the well site or firebreak.</li> <li>Cuttings and remaining drilling fluids will be tested at completion of drilling to inform disposal.</li> <li>Risk of groundwater influx is known to be low given numerous wells drilled in the area.</li> </ul>	Given the mitigation and management measures that will be implemented surface and ground water contamination is considered unlikely.	<ul style="list-style-type: none"> <li>Weekly inspection/checklist of the Activity area.</li> <li>OCR (Drilling Supervisor) to ensure all cuttings stored within cuttings facility.</li> <li>Baseline and post operations groundwater quality and depth sampling.</li> <li>Inspection of rain water in bunds for contamination prior to discharge.</li> <li>Inspection/checklist of the Activity area following demobilisation for waste.</li> </ul>
Landforms and Soil	<p>Landforms of the Activity area are described as sandplains, with deep red and yellow sands, pindan and other low woodlands.</p> <p>The Activity areas are classified as having an extremely low probability of occurrence of acid sulphate soils.</p>	<p>Erosion and sedimentation.</p> <p>Disturbance of acid sulphate soils.</p>	<ul style="list-style-type: none"> <li>The Activity areas will be constructed to minimise disturbance of soil and landforms.</li> <li>Cement, polymer, gravel, etc. will only be used in parts of the well sites, camp sites, laydown areas and access tracks that require additional compaction and stabilisation.</li> <li>In the event of heavy rainfall during construction, earthmoving operations will cease. An assessment will be undertaken prior to recommencing operations.</li> </ul>	Through the implementation of management measures, it is unlikely that the Activity will have a significant impact on landforms.	
Vegetation and Flora	<p>Dominant vegetation types described during the on-ground surveys were broadly consistent with vegetation units previously described by Beard (1979):</p> <ul style="list-style-type: none"> <li>Kurrajong 1: Dampierland 699 (shrublands);</li> <li>Ungani West 1: Dampierland 64 (grasslands);</li> <li>Rafael 1 and Yakka Munga 1: Dampierland 7001 (shrublands).</li> </ul> <p>These vegetation types are considered to be widespread throughout the region and not considered to be representative of any listed threatened ecological communities or priority ecological communities, and none are expected to occur.</p> <p>No threatened flora species were identified in the Activity areas. The Activity areas are not within any areas of conservation (e.g. ESAs).</p>	Loss of native flora species including competition by weed species.	<ul style="list-style-type: none"> <li>Earthmoving machinery and equipment will be inspected and cleaned prior to arrival at the Activity area.</li> <li>Externally sourced gravel will be weed free.</li> <li>For each well site, a Civils Work Program will be prepared for civil construction operations.</li> <li>Following completion of drilling each well, demobilisation will be undertaken.</li> <li>Following well plug and abandonment, rehabilitation will be implemented. Environmental monitoring of rehabilitation will then commence.</li> </ul>	Through the implementation of management measures, it is unlikely that the Activity will have a significant impact on vegetation and flora.	<ul style="list-style-type: none"> <li>OCR to ensure earthmoving machinery and equipment are inspected and cleaned prior to arrival.</li> <li>Inspection for weeds following demobilisation and rehabilitation.</li> <li>OCR to ensure that clearing is limited to the Activity area.</li> </ul>
Fauna	<p>The only conservation significant fauna species identified in the vicinity of the Activity areas are highly mobile bird species and potentially a Spectacled hare-wallaby scat.</p> <p>These species are not considered to be specifically reliant on habitat contained within the Activity area, and equivalent habitat exists more widely in the surrounding region.</p>	<p>Loss of a local population of a conservation significant fauna species.</p> <p>Disturbance of fauna.</p>	<ul style="list-style-type: none"> <li>Vehicle and personnel access will be limited to Activity area.</li> <li>Fence surrounding open lined excavations will be left in place to prevent macro-fauna access.</li> <li>Egress paths installed in open lined excavations.</li> <li>Travel in accordance with the <i>Travel Management Procedure</i> (HSE-PRO-002).</li> </ul>	Through the implementation of management measures, it is unlikely that the Activity will have a significant impact on conservation significant fauna species.	<ul style="list-style-type: none"> <li>Following construction, a survey of the well site to confirm size of cleared area.</li> </ul>
Cultural Heritage and Local Community	<p>The townships of Broome and Derby are the largest population centres near the Activities. The nearest Aboriginal Communities are over 35 km from the Activity areas. The Activity areas are located within sparsely populated regions with limited settlement, transport or communications infrastructure.</p> <p>The Activity areas are located within Yawuru and Nyikina Mangala land and on the Roebuck Plains, Yakka Munga and Luluigui pastoral leases.</p>	<p>Disturbance of heritage site.</p> <p>Disturbance of stock.</p> <p>Disturbance of local station or community.</p>	<ul style="list-style-type: none"> <li>Ongoing liaison with relevant stakeholders.</li> <li>The Company will undertake a heritage survey with Traditional Owners prior to commencing the Activities. Operations will not commence until heritage clearance is obtained.</li> <li>Representatives Traditional Owners will conduct cultural heritage monitoring of civil works.</li> </ul>	Given the implementation of the management measures, impacts on cultural heritage and the community are unlikely.	<ul style="list-style-type: none"> <li>OCR to ensure vehicles and personnel limited to access tracks, camp sites and well sites.</li> <li>Monitoring of civil works undertaken by Traditional Owner representatives.</li> </ul>

### **3.1. Communication and Consultation**

The Company has engaged in communication and consultation with relevant stakeholders as summarised in the Environment Plan. As the Activity is located within a sparsely populated region with limited settlement, transport or communications infrastructure, relevant stakeholders are limited to government departments, traditional owners and pastoralists. The stakeholders consulted with to date include:

- Nyikina Mangala Traditional Owners;
- Yawuru Traditional Owners;
- Luluigui Pastoral Station;
- Yakka Munga Pastoral Station;
- Roebuck Plains Pastoral Station; and
- Department of Water and Environmental Regulation.

These stakeholders have been consulted via phone, written notices and face-to-face meetings.

To date any issues that have been raised in relation to the Activity through the consultation process have been able to be addressed and resolved. The Company will continue to communicate with stakeholders and consult during the Activity.

The Company will not commence any Activity until the results of the relevant heritage survey are known, and will ensure that it complies with the terms of the heritage survey provided by Traditional Owners.

## **11. Toxicological Information**

### **Information on routes of exposure**

**Principle Route of Exposure** Eye or skin contact, inhalation.

### **Symptoms related to exposure**

#### **Most Important Symptoms/Effects**

Breathing crystalline silica can cause lung disease, including silicosis and lung cancer. Crystalline silica has also been associated with scleroderma and kidney disease.

### **Numerical measures of toxicity**

### **Toxicology data for the components**

Substances	CAS Number	LD50 Oral	LD50 Dermal	LC50 Inhalation
Crystalline silica, quartz	14808-60-7	> 15000 mg/kg (human)	No information available	No data available

### **Immediate, delayed and chronic health effects from exposure**

#### **Inhalation**

Inhaled crystalline silica in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (IARC, Group 1). There is sufficient evidence in experimental animals for the carcinogenicity of tridymite (IARC, Group 2A).

Breathing silica dust may cause irritation of the nose, throat, and respiratory passages. Breathing silica dust may not cause noticeable injury or illness even though permanent lung damage may be occurring. Inhalation of dust may also have serious chronic health effects (See "Chronic Effects/Carcinogenicity" subsection below).

#### **Eye Contact**

May cause mechanical irritation to eye.

#### **Skin Contact**

None known.

#### **Ingestion**

None known.

### **Chronic Effects/Carcinogenicity**

**Silicosis:** Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis.

**Cancer Status:** The International Agency for Research on Cancer (IARC) has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources can cause lung cancer in humans (Group 1 - carcinogenic to humans) and has determined that there is sufficient evidence in experimental animals for the carcinogenicity of tridymite (Group 2A - possible carcinogen to humans). Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997) in conjunction with the use of these minerals. The National Toxicology Program classifies respirable crystalline silica as "Known to be a human carcinogen". Refer to the 9th Report on Carcinogens (2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2). There is some evidence that breathing respirable crystalline silica or the disease silicosis is associated with an increased incidence of significant disease endpoints such as scleroderma (an immune system disorder manifested by scarring of the lungs, skin, and other internal organs) and kidney disease.

**Exposure Levels**

No data available

**Interactive effects**

Individuals with respiratory disease, including but not limited to asthma and bronchitis, or subject to eye irritation, should not be exposed to quartz dust.

### Information on routes of exposure

**Principle Route of Exposure** Eye or skin contact, inhalation.

### Symptoms related to exposure

#### **Most Important Symptoms/Effects**

Breathing crystalline silica can cause lung disease, including silicosis and lung cancer. Crystalline silica has also been associated with scleroderma and kidney disease.

### Numerical measures of toxicity

### Immediate, delayed and chronic health effects from exposure

#### **Product Information**

##### **Inhalation**

Under certain conditions of use, some of the product ingredients may cause the following:  
Inhaled crystalline silica in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (IARC, Group 1). There is sufficient evidence in experimental animals for the carcinogenicity of tridymite (IARC, Group 2A).

Breathing silica dust may cause irritation of the nose, throat, and respiratory passages. Breathing silica dust may not cause noticeable injury or illness even though permanent lung damage may be occurring. Inhalation of dust may also have serious chronic health effects (See "Chronic Effects/Carcinogenicity" subsection below).

##### **Eye Contact**

May cause mechanical irritation to eye.

##### **Skin Contact**

None known.

##### **Ingestion**

May produce nervous system effects such as feeling of weakness, unsteady walk, and dilation of blood vessels. May affect the heart and cardiovascular system.

#### **Chronic Effects/Carcinogenicity**

**Silicosis:** Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis.

**Cancer Status:** The International Agency for Research on Cancer (IARC) has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources can cause lung cancer in humans (Group 1 - carcinogenic to humans) and has determined that there is sufficient evidence in experimental animals for the carcinogenicity of tridymite (Group 2A - possible carcinogen to

humans). Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997) in conjunction with the use of these minerals. The National Toxicology Program classifies respirable crystalline silica as "Known to be a human carcinogen". Refer to the 9th Report on Carcinogens (2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2). There is some evidence that breathing respirable crystalline silica or the disease silicosis is associated with an increased incidence of significant disease endpoints such as scleroderma (an immune system disorder manifested by scarring of the lungs, skin, and other internal organs) and kidney disease.

Prolonged inhalation of fine barium sulfate dusts form harmless nodular granules in lung, an affliction called baritosis. Baritosis produces no symptoms of bronchitis or emphysema, and lung functioning is not affected although dyspnea, upon exertion, may occur. The nodulation disappears if exposure is stopped.

#### **Exposure Levels**

No data available

#### **Interactive effects**

Individuals with respiratory disease, including but not limited to asthma and bronchitis, or subject to eye irritation, should not be exposed to quartz dust.

### Appropriate engineering controls

#### Engineering Controls

Use in a well ventilated area. Local exhaust ventilation should be used in areas without good cross ventilation.

### Personal protective equipment (PPE)

#### Personal Protective Equipment

If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the specific application of this product.

#### Respiratory Protection

If engineering controls and work practices cannot keep exposure below occupational exposure limits or if exposure is unknown, wear a NIOSH certified, European Standard EN 149, AS/NZS 1715:2009, or equivalent respirator when using this product. Selection of and instruction on using all personal protective equipment, including respirators, should be performed by an Industrial Hygienist or other qualified professional.

When the potential exists for heated vapors or fumes of this product to be created, use a respirator with an organic-vapor filter or a supplied-air respirator as needed for adequate protection.

#### Hand Protection

Chemical-resistant protective gloves (EN 374) Suitable materials for longer, direct contact (recommended: protection index 6, corresponding to > 480 minutes permeation time as per EN 374): Butyl rubber gloves. (>= 0.7 mm thickness)

This information is based on literature references and on information provided by glove manufacturers, or is derived by analogy with similar substances. Please note that in practice the working life of chemical-resistant protective gloves may be considerably shorter than the permeation time determined in accordance with EN 374 as a result of the many influencing factors (e.g. temperature). If signs of wear and tear are noticed then the gloves should be replaced.

#### Skin Protection

Rubber apron.

#### Eye Protection

Chemical goggles; also wear a face shield if splashing hazard exists.

#### Other Precautions

Eyewash fountains and safety showers must be easily accessible. Rubber boots

#### Environmental Exposure Controls

Do not allow material to contaminate ground water system

This information is based on literature references and on information provided by glove manufacturers, or is derived by analogy with similar substances. Please note that in practice the working life of chemical-resistant protective gloves may be considerably shorter than the permeation time determined in accordance with EN 374 as a result of the many influencing factors (e.g. temperature). If signs of wear and tear are noticed then the gloves should be replaced. Manufacturer's directions for use should be observed because of great diversity of types.

## 4. FIRST AID MEASURES

**Eye** If in eyes, hold eyelids apart and flush continuously with running water. Continue flushing until advised to stop by a Poisons Information Centre, a doctor, or for at least 15 minutes.

**Inhalation** If inhaled, remove from contaminated area. To protect rescuer, use a Full-face Type B (Inorganic and acid gas) respirator or an Air-line respirator (in poorly ventilated areas). Apply artificial respiration if not breathing.

**Skin** If skin or hair contact occurs, remove contaminated clothing and flush skin and hair with running water.

**Ingestion** For advice, contact a Poison Information Centre on 13 11 26 (Australia Wide) or a doctor (at once). If swallowed, do not induce vomiting.

**Advice to Doctor** CORROSIVE POISONING TREATMENT: Immediate treatment preferably in a hospital is mandatory. It is also important to attempt to discover the chemical substances ingested. In treating corrosive poisoning, DO NOT INDUCE VOMITING; DO NOT ATTEMPT GASTRIC LAVAGE; and DO NOT ATTEMPT TO NEUTRALISE THE CORROSIVE SUBSTANCE. Vomiting will increase the severity of damage to the oesophagus as the corrosive substance will again come in contact with it. Attempting gastric lavage may result in perforating either the oesophagus or stomach.

Product Name **HYDROCHLORIC ACID 32% (COOGEE CHEMICALS)**

Immediately dilute the corrosive substance by having the patient drink milk or water. If the trachea has been damaged tracheostomy may be required. For oesophageal burns begin broad-spectrum antibiotics and corticosteroid therapy. Intravenous fluids will be required if oesophageal or gastric damage prevents ingestion of liquids. Long-range therapy will be directed toward preventing or treating oesophageal scars and strictures.

**First Aid Facilities** Eye wash facilities and safety shower should be available.

## 5. FIRE FIGHTING MEASURES

<b>Flammability</b>	Non flammable. May evolve toxic gases (chlorides) when heated to decomposition. May evolve flammable hydrogen gas when in contact with some metals.
<b>Fire and Explosion</b>	Evacuate area and contact emergency services. Toxic gases may be evolved in a fire situation. Remain upwind and notify those downwind of hazard. Wear full protective equipment including Self Contained Breathing Apparatus (SCBA) when combating fire. Use waterfog to cool intact containers and nearby storage areas.
<b>Extinguishing</b>	Prevent contamination of drains or waterways.
<b>Hazchem Code</b>	2R

## 6. ACCIDENTAL RELEASE MEASURES

<b>Spillage</b>	Contact emergency services where appropriate. Use personal protective equipment. Clear area of all unprotected personnel. Ventilate area where possible. Contain spillage, then cover / absorb spill with sodium bicarbonate or 50 -50 mixture of sodium carbonate and calcium hydroxide. Collect for complete neutralisation and appropriate disposal.
-----------------	---

## 7. STORAGE AND HANDLING

<b>Storage</b>	Store in secured, cool, dry, well ventilated area, removed from oxidising agents, alkalis, most metals, alcohols, acids, dinitroaniline, cyanides, sulphides, heat or ignition sources and foodstuffs. Ensure containers are labelled, protected from physical damage and sealed when not in use. Check regularly for leaks or spills. Large storage areas should have appropriate ventilation systems. Also store removed from amines.
<b>Handling</b>	Before use carefully read the product label. Use of safe work practices are recommended to avoid eye or skin contact and inhalation. Observe good personal hygiene, including washing hands before eating. Prohibit eating, drinking and smoking in contaminated areas.

**11. TOXICOLOGICAL INFORMATION**

**Health Hazard Summary** Highly corrosive. This product has the potential to cause serious adverse health effects. Use safe work practices to avoid eye or skin contact and inhalation. Over exposure may result in severe skin, eye and respiratory burns with permanent lung and tissue damage. Upon dilution, the potential for adverse health effects may be reduced.

**Eye** Highly corrosive. Contact may result in irritation, lacrimation, pain, redness, conjunctivitis and corneal burns with possible permanent damage.

**Inhalation** Toxic - corrosive. Over exposure may result in irritation of the nose and throat, coughing and bronchitis. High level exposure may result in intense thirst, ulceration, lung tissue damage, chemical pneumonitis and pulmonary oedema. Effects may be delayed.

**12. ECOLOGICAL INFORMATION**

**Environment** If hydrochloric acid is spilled on soil, it will infiltrate. During its transport through soil, the acid will dissolve some of the soil material, in particular carbonates, and will be neutralised to some degree. However, significant amounts of acid are expected to remain for transport down to groundwater. Toxic to aquatic invertebrates at low levels (LC50: 1.21 ppm/96 hours).

**13. DISPOSAL CONSIDERATIONS**

**Waste Disposal** Wearing the protective equipment detailed above, neutralise to pH 6-8 by SLOW addition to a saturated sodium bicarbonate solution or similar basic solution. Dilute with excess water and flush to drain. Waste disposal should only be undertaken in a well ventilated area.

**Legislation** Dispose of in accordance with relevant local legislation.

## 16. OTHER INFORMATION

**Additional Information** RESPIRATORS: In general the use of respirators should be limited and engineering controls employed to avoid exposure. If respiratory equipment must be worn ensure correct respirator selection and training is undertaken. Remember that some respirators may be extremely uncomfortable when used for long periods. The use of air powered or air supplied respirators should be considered where prolonged or repeated use is necessary.

ACIDS: When mixing acids with water (diluting), caution must be taken as heat will be generated which causes violent spattering. Always add a small volume of acid to a large volume of water, NEVER the reverse.

Acetic acid	64-19-7	TWA: 10 ppm	TWA: 10 ppm STEL: 15 ppm

### 8.2 Appropriate engineering controls

#### Engineering Controls

Use in a well ventilated area. Local exhaust ventilation should be used in areas without good cross ventilation.

### 8.3 Individual protection measures, such as personal protective equipment

#### Personal Protective Equipment

If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the specific application of this product.

#### Respiratory Protection

If engineering controls and work practices cannot keep exposure below occupational exposure limits or if exposure is unknown, wear a NIOSH certified, European Standard EN 149, AS/NZS 1715:2009, or equivalent respirator when using this product. Selection of and instruction on using all personal protective equipment, including respirators, should be performed by an Industrial Hygienist or other qualified professional.

#### Hand Protection

Chemical-resistant protective gloves (EN 374) Suitable materials for longer, direct contact (recommended: protection index 6, corresponding to > 480 minutes permeation time as per EN 374): Nitrile gloves. (>= 0.35 mm thickness)  
This information is based on literature references and on information provided by glove manufacturers, or is derived by analogy with similar substances. Please note that in practice the working life of chemical-resistant protective gloves may be considerably shorter than the permeation time determined in accordance with EN 374 as a result of the many influencing factors (e.g. temperature). If signs of wear and tear are noticed then the gloves should be replaced. Manufacturer's directions for use should be observed because of great diversity of types.

#### Skin Protection

Full protective chemical resistant clothing.

#### Eye Protection

Chemical goggles; also wear a face shield if splashing hazard exists.

#### Other Precautions

Eyewash fountains and safety showers must be easily accessible.

## 11. Toxicological Information

**Information on routes of exposure**

**Principle Route of Exposure** Eye or skin contact, inhalation.

**Symptoms related to exposure****Most Important Symptoms/Effects**

Causes severe eye irritation which may damage tissue. Causes skin irritation. May cause allergic skin reaction. May cause respiratory irritation. Breathing crystalline silica can cause lung disease, including silicosis and lung cancer. Crystalline silica has also been associated with scleroderma and kidney disease.

**Numerical measures of toxicity****Toxicology data for the components**

Substances	CAS Number	LD50 Oral	LD50 Dermal	LC50 Inhalation
Portland cement	65997-15-1	> 2000 mg/kg (Rat)	> 2000 mg/kg	> 1 mg/L (Rat) 4h
Crystalline silica, quartz	14808-60-7	> 15000 mg/kg (human)	No information available	No data available

**Immediate, delayed and chronic health effects from exposure****Inhalation**

Inhaled crystalline silica in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (IARC, Group 1). There is sufficient evidence in experimental animals for the carcinogenicity of tridymite (IARC, Group 2A).

Breathing silica dust may cause irritation of the nose, throat, and respiratory passages. Breathing silica dust may not cause noticeable injury or illness even though permanent lung damage may be occurring. Inhalation of dust may also have serious chronic health effects (See "Chronic Effects/Carcinogenicity" subsection below).

Causes severe respiratory irritation.

**Eye Contact**

Causes severe eye irritation which may damage tissue.

**Skin Contact**

Causes skin irritation. Can dry skin. May cause alkali burns with confined contact. May cause an allergic skin reaction.

**Ingestion**

None known.

**Chronic Effects/Carcinogenicity** Silicosis: Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis.

Cancer Status: The International Agency for Research on Cancer (IARC) has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources can cause lung cancer in humans (Group 1 - carcinogenic to humans) and has determined that there is sufficient evidence in experimental animals for the carcinogenicity of tridymite (Group 2A - possible carcinogen to humans). Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997) in conjunction with the use of these minerals. The National Toxicology Program classifies respirable crystalline silica as "Known to be a human carcinogen". Refer to the 9th Report on Carcinogens (2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2). There is some evidence that breathing respirable crystalline silica or the disease silicosis is associated with an increased incidence of significant disease endpoints such as scleroderma (an immune system disorder manifested by scarring of the lungs, skin, and other internal organs) and kidney disease.

## **11. Toxicological Information**

#### **Information on routes of exposure**

**Principle Route of Exposure** Eye or skin contact, inhalation.

#### **Symptoms related to exposure**

#### **Most Important Symptoms/Effects**

Breathing crystalline silica can cause lung disease, including silicosis and lung cancer. Crystalline silica has also been associated with scleroderma and kidney disease.

#### **Numerical measures of toxicity**

#### **Toxicology data for the components**

Substances	CAS Number	LD50 Oral	LD50 Dermal	LC50 Inhalation
Crystalline silica, quartz	14808-60-7	> 15000 mg/kg (human)	No information available	No data available
Crystalline silica, cristobalite	14464-46-1	>15,000 mg/kg (Human)	No data available	No data available
Crystalline silica, tridymite	15468-32-3	>15,000 mg/kg (Human)	No data available	No data available

#### **Immediate, delayed and chronic health effects from exposure**

##### **Inhalation**

Inhaled crystalline silica in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (IARC, Group 1). There is sufficient evidence in experimental animals for the carcinogenicity of tridymite (IARC, Group 2A).

Breathing silica dust may cause irritation of the nose, throat, and respiratory passages. Breathing silica dust may not cause noticeable injury or illness even though permanent lung damage may be occurring. Inhalation of dust may also have serious chronic health effects (See "Chronic Effects/Carcinogenicity" subsection below).

##### **Eye Contact**

May cause mechanical irritation to eye.

##### **Skin Contact**

None known.

##### **Ingestion**

None known.

#### **Chronic Effects/Carcinogenicity**

**Silicosis:** Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis.

**Cancer Status:** The International Agency for Research on Cancer (IARC) has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources can cause lung cancer in humans (Group 1 - carcinogenic to humans) and has determined that there is sufficient evidence in experimental animals for the carcinogenicity of tridymite (Group 2A - possible carcinogen to humans). Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997) in conjunction with the use of these minerals. The National Toxicology Program classifies respirable crystalline silica as "Known to be a human carcinogen". Refer to the 9th Report on Carcinogens (2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2). There is some evidence

that breathing respirable crystalline silica or the disease silicosis is associated with an increased incidence of significant disease endpoints such as scleroderma (an immune system disorder manifested by scarring of the lungs, skin, and other internal organs) and kidney disease.

### Personal protective equipment (PPE)

#### **Personal Protective Equipment**

If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the specific application of this product.

#### **Respiratory Protection**

If engineering controls and work practices cannot keep exposure below occupational exposure limits or if exposure is unknown, wear a NIOSH certified, European Standard EN 149, AS/NZS 1715:2009, or equivalent respirator when using this product. #### **Hand Protection**

Chemical-resistant protective gloves (EN 374) Suitable materials for longer, direct contact (recommended: protection index 6, corresponding to > 480 minutes permeation time as per EN 374): (>= 0.4 mm thickness)

This information is based on literature references and on information provided by glove manufacturers, or is derived by analogy with similar substances. Please note that in practice the working life of chemical-resistant protective gloves may be considerably shorter than the permeation time determined in accordance with EN 374 as a result of the many influencing factors (e.g. temperature). If signs of wear and tear are noticed then the gloves should be replaced. Manufacturer's directions for use should be observed because of great diversity of types.

#### **Skin Protection**

Full protective chemical resistant clothing.

#### **Eye Protection**

Chemical goggles; also wear a face shield if splashing hazard exists.

#### **Other Precautions**

Eyewash fountains and safety showers must be easily accessible.

#### **Environmental Exposure Controls**

#### **Personal Protective Equipment**

If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the specific application of this product.

<b>Respiratory Protection</b>	If engineering controls and work practices cannot keep exposure below occupational exposure limits or if exposure is unknown, wear a NIOSH certified, European Standard EN 149, AS/NZS 1715:2009, or equivalent respirator when using this product. Selection of and instruction on using all personal protective equipment, including respirators, should be performed by an Industrial Hygienist or other qualified professional. Positive pressure self-contained breathing apparatus if methanol is released.
<b>Hand Protection</b>	Chemical-resistant protective gloves (EN 374) Suitable materials for longer, direct contact (recommended: protection index 6, corresponding to > 480 minutes permeation time as per EN 374): Neoprene gloves. Nitrile gloves. Butyl rubber gloves. (>= .? mm thickness) This information is based on literature references and on information provided by glove manufacturers, or is derived by analogy with similar substances. Please note that in practice the working life of chemical-resistant protective gloves may be considerably shorter than the permeation time determined in accordance with EN 374 as a result of the many influencing factors (e.g. temperature). If signs of wear and tear are noticed then the gloves should be replaced. Manufacturer's directions for use should be observed because of great diversity of types.
<b>Skin Protection</b>	Rubber apron.
<b>Eye Protection</b>	Chemical goggles; also wear a face shield if splashing hazard exists.
<b>Other Precautions</b>	Eyewash fountains and safety showers must be easily accessible.
<b>Environmental Exposure Controls</b>	Do not allow material to contaminate ground water system
